Agenda

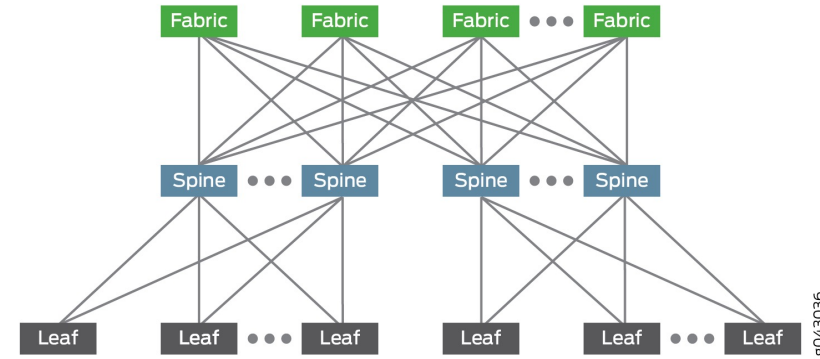

- Intro to data center networking
 - Datacenter Fabric and Switching
 - VXLAN / EVPN / Clos topologies
- The Apstra Intent Based approach
 - The importance of the intent
 - Closed loop network management
- Demo

Problem: Creation of a Datacenter Network

- Need of a switch / router with many hundreds of ports
- Limit to the number of ports of a physical device (even the biggest ones)
 - Physical limitations
 - Geographical limitations (can't cover the entire campus with a single device)
 - Single point of failure limitations
 - Bandwidth limitations
- Usage of many switches connected to each other
 - **Spanning tree** makes active-active balancing hard
 - Changes of topology cause disruptions
 - End host change of port causes short disruptions
- Need for a conceptual fabric emulating a switch, with arbitrarily large bandwidth between any endpoint pair
 - Overlay a fake ethernet fabric over an IP underlay

Underlay: IP-based Clos network (3-stage, 5-stage)

Overlay: VXLAN for the data plane

- Allows encapsulation of layer-2 (ethernet) packets in UDP
- So it becomes possible to use an already existing IP network as a switch
- Instead of real Ethernet frames between links, now there are UDP packets in the IP links
- Routing and traffic engineering is now possible, load balancing, quick recovery, etc.

Overlay: BGP EVPN for the fabric control plane

- Switching control plane: 802.1d mac learning, broadcast
- Additionally: ARP / NDP, IPv4 / IPv6 routing

- Use BGP as the protocol to make the control plane communicate
- L2VPN/EVPN BGP address family to emulate the control plane functions (and beyond) of a real switch

- EVPN route types:
 - Type 1: Ethernet segment Identifier
 - Type 2: Mac route or Mac/IP route (includes ARP)
 - Type 3: BUM traffic delivery
 - Type 5: Pure IP routes (to cross between virtual segments)

Management of a fabric

- A traditional switch is relatively easy to configure and maintain, no serious monitoring necessary (example, a small home)
- A switch topology with VLANs is somewhat tricky to configure, easy to maintain and hard to monitor (example: the NTUA campus)
- An IP based fabric using EVPN / VXLAN is hard to configure, maintain and monitor
- Conclusion: A DC fabric cannot be approached using the same management principles
 - *Need for automation*

“Traditional” Automation

- Configuration
 - Ansible
 - Chef
 - Puppet
 - SaltStack
 - Perl / Python / Ruby and libraries
- Monitoring and data collection
 - MRTG, Kibana, Grafana,
 - Prometheus
 - InfluxDB

(apologies for any fine tools and libraries not mentioned here)

Problems:

- Too much focus on how instead of why and what
- A human is needed as a CPU to parse the provided information – The real state of the network is stored in (one or more) humans
- Difference between ***syntax*** and ***semantics***
- The elephant in the room: Need for an operations-centric approach with a single source of truth

Operations day in the life

Chapter 1

New Launch!

Set up of VLANs, VMs, etc. in minutes

Chapter 3

Postponed Launch

All network rollback in less than a minute

Chapter 2

Corrupted Config

Quick visibility to root cause in intuitive dashboard

Chapter 4

Scale to Meet New Demand

Scale new resources with pre-validated templates

Challenges of Day 2+ Operations

Network teams have too much to do....

- Monitoring tool proliferation and # of devices/components mean 'needle in a haystack' challenge to pinpoint issues
- **Cross-functional finger-pointing**—networking teams on the defense and must prove innocence
- Length of time to **roll back** a change when issues arise
- **Change review** is onerous—delays new services and important fixes
- Too many **CLI** touchpoints for just one change
- **Lack of visibility** to grey failures to get ahead of device issues and prevent user impact
- **Security patches** and NOS updates can take long to plan and require (or trigger) outages
- **Lack perspective** of the whole network to understand what's going on
- **Multi-vendor** creates challenges in setup, visibility, and trouble identification
- **Networking skills scarcity** can make hiring challenging

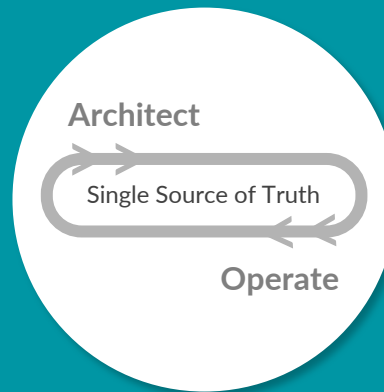

Juniper Apstra difference

Operate the Network as One System

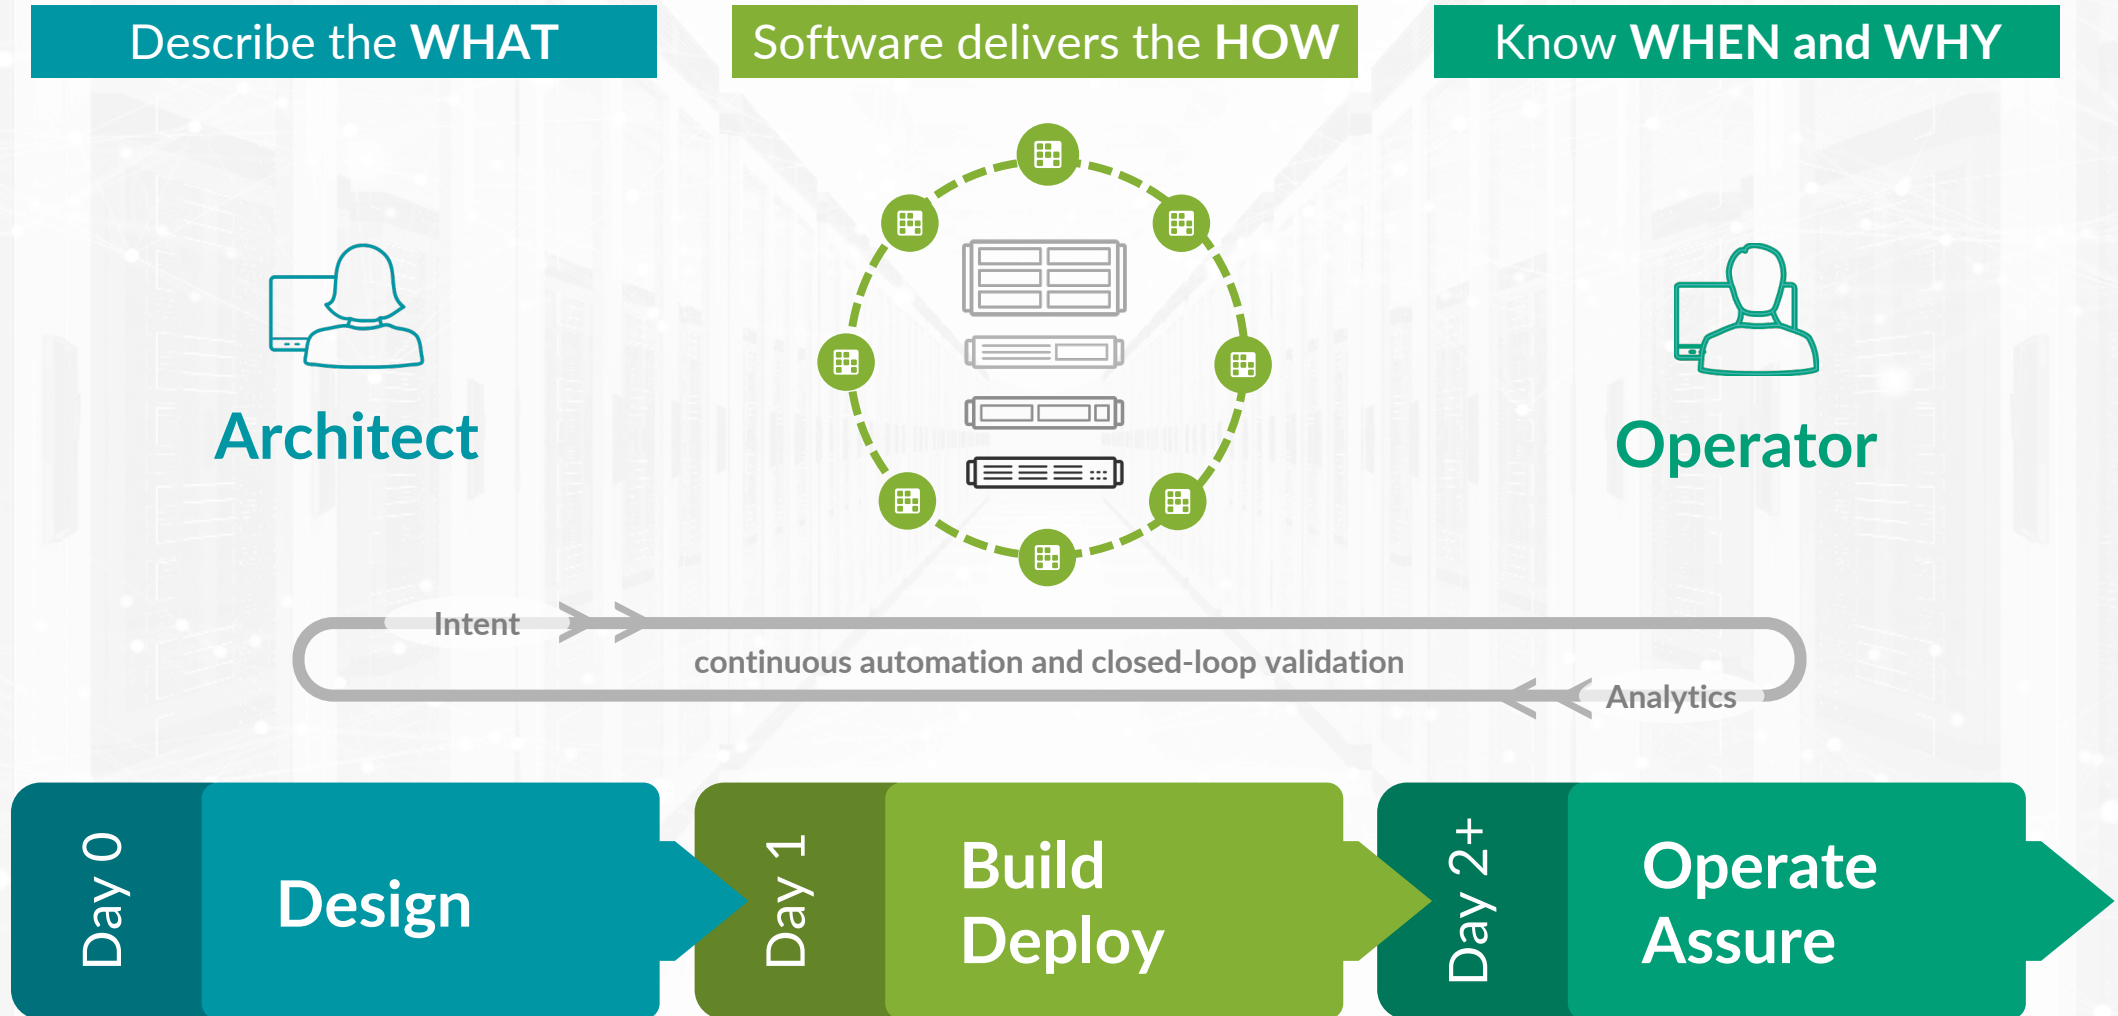

A Unified, Intent-based Approach

Open and Multi-vendor

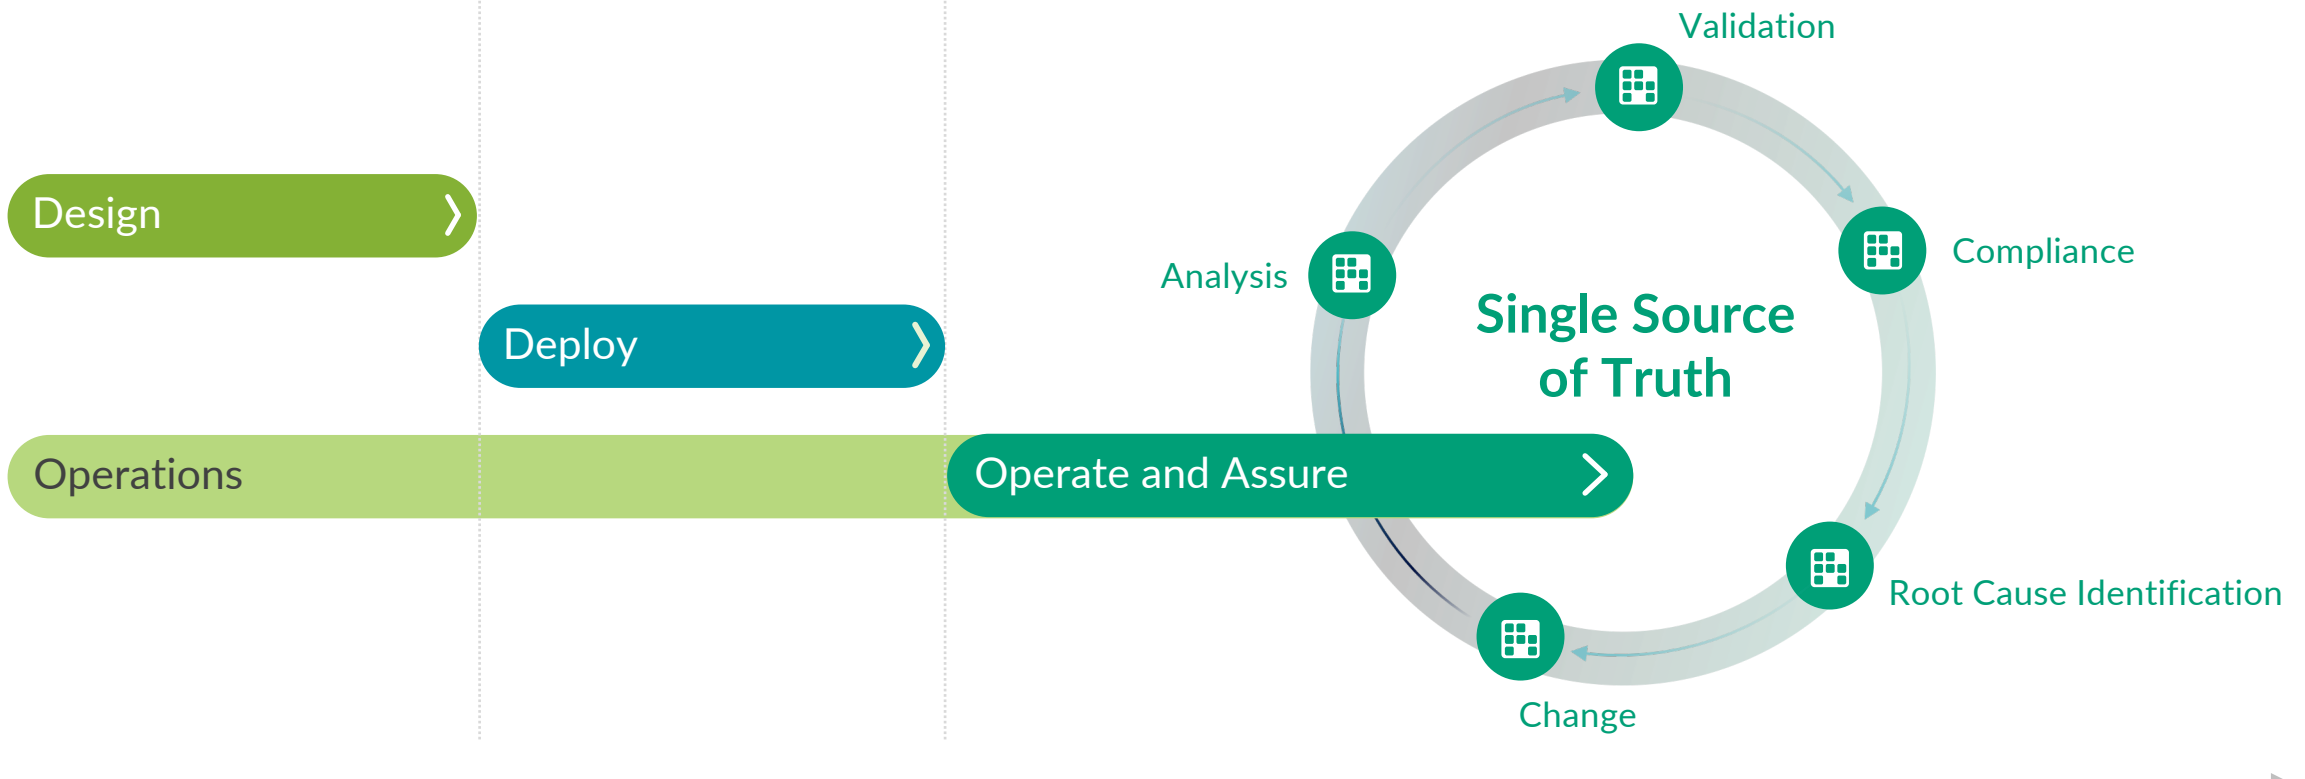

One Unified Solution, Consistent Experience

Automate every day

Automate and Assure Your Data Center

Day 0

Reference design
Pre-validation
Install

Day 1

Zero-touch provisioning
Test
Validate

Day 2+

Visibility / Analytics / Insights
Troubleshoot/ Remediate
Optimize

Change management
Maintain / Update
Compliance / Audit

Apstra: Intent Based Networking Solution details

- Standardised Reference Design Solutions

- Works across Tier-1 vendors such as Junos (+Junos Evolved), SONiC, NXOS, EOS, Cumulus

- OPEX saving advantage

- Abstract scalable **Blueprint** for DC networks design (CLOS)
 - Template can be replicated across large DCs
- Dynamic configuration generation following the **Intent**
 - Graceful handling of day-2 operations
- Closed loop device management
 - Device *expected* state monitoring by **telemetry** components
 - Verification of **Intent**, detection of **deviations**

- Fast problem resolution

- Intent-Based Analytics
- Root Cause Identification

Apstra Key Technologies

Intent-Based Networking

Benefit: Simplify effort of architects and operators to design, deploy and operate

Outcome: Transformed focus on the business results with insights for continuous improvement

Single Source of Truth

Benefit: Speed operations actions with repeatable, vendor-agnostic blueprints and knowledge graphs

Outcome: Faster migration/change with more time on value (not the arcane semantics of management)

Closed-Loop Validation

Benefit: Assure with continuous verification, proactive insights and root cause analysis

Outcome: Reduce problems, outages and mean time to repair while raising operational efficiency

Time Voyager Rollback

Benefit: Avoid change issues with visibility, fast rollback and system-documented change control

Outcome: Reduce business impact of errors and assure compliance, auditing and knowledge retention

Maintenance/Upgrade Mode

Benefit: Separate HW/SW upgrade cycles to reduce maintenance windows and planned downtime

Outcome: Increased commitments to SLAs and user satisfaction and lowered risks of outdated software

Flexible Integrations

Benefit: Support existing and future cross-organizational workflows and new vendors

Outcome: Quick compliance to changing business operations and lower cost of technology adoption

Demonstration

The screenshot displays the Juniper Network Manager interface. At the top, there are navigation tabs: Dashboard, Analytics, Staged, Uncommitted, Active, and Time Voyager. Below these are functional tabs: Physical, Virtual, Policies, Catalog, Settings, Query, Anomalies, and Root Causes. The main area shows a network topology diagram with nodes like spine1, spine2, leaf1, leaf2, leaf3, and various servers. A right-hand sidebar lists various anomaly categories with counts, such as 'Anomalies: All Services' (0), 'Anomalies: BGP' (0), and 'Anomalies: Probes' (5). The interface also includes filters for Nodes, Links, and Racks, and options for Topology Label and Show Links.

Dashboard Analytics Staged Uncommitted Active Time Voyager

Physical Virtual Policies Catalog Settings Query Anomalies Root Causes

Nodes: All Links: All Selection Status

Topology Nodes Links Racks Layer Anomalies: All Services

Grouped Compact Full No Anomalies Anomalies Present

Selected Rack: All Selected Node: All Topology Label: Name

Expand Nodes? Show Links?

Diagram nodes: rtr_leaf1_leaf2, spine1, spine2, evpn_mlag_001 (leaf1, leaf2, rack1-server1, switch1-server1, switch2-server1), evpn_single_001 (leaf3, switch3-server1)

Right sidebar anomalies:

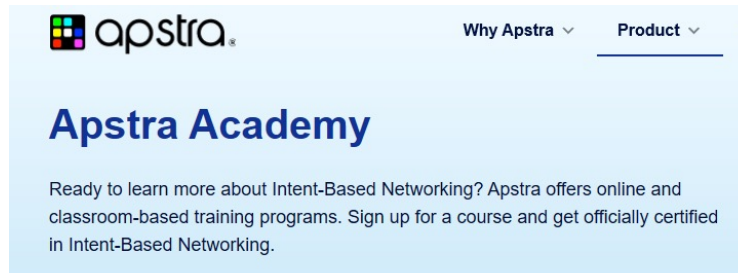

- 0 Anomalies: All Services
- 0 Anomalies: BGP
- 0 Anomalies: Cabling
- 0 Anomalies: Config
- 0 Anomalies: Hostname
- 0 Anomalies: Interface
- 0 Anomalies: LAG
- 0 Anomalies: Liveness
- 0 Anomalies: MLAG
- 5 Anomalies: Probes
- 0 Anomalies: Route
- 5/0/0/0 Deploy Mode
- 0/0/0 Deployment Status: Discovery
- 0/0/0 Deployment Status: Drain
- 5/0/0 Deployment Status: Service
- 0 Traffic Heat

Active Tasks: 0
